Filter elements

Elements remove 95% of particles larger than the nominal pore size.

Nominal pore Size μm	Pore Size Range μm
0.5	0.5 to 2
2	1 to 4
7	5 to 10
15	11 to 25
60	50 to 75
90	75 to 100

Operation and Filter Replacement

The filter element, which is made of sintered stainless steel, is porous and has lots of tiny holes. Particles bigger than the pores are not allowed to pass through, hence clean system media. After a certain period, the holes may be blocked by particles and pressure drop will increase. This depends upon the total flow through the elements and cleanliness of upstream flow. The element needs to be replaced for clean system media with minimal pressure drop.
